# APPENDICES

# Appendix A - Glossary

**Built Environment** 

Artificially created fixed elements, such as buildings, structures, devices, and surfaces, that together creates the physical character of an area.

Critical Area

An area with one or more of the following environmental characteristics: (1) steep slopes; (2) flood plain; (3) soils classified as having high water tables; (4) soils classified as highly erodible, subject to erosion, or highly acidic; (5) land incapable of meeting percolation requirements; (6) land formerly used for landfill operations or hazardous industrial use; (7) fault areas; (8) stream corridors; (9) estuaries; (10) mature stands of native vegetation; (11) aquifer recharge and discharge areas; (12) wetlands and wetland transition areas; and (13) habitats of endangered species.

Crucial Area

An area that is environmentally sensitive to ground water contamination due to factors such as shallow depth to ground water or previous contamination. The crucial area is further defined and identified in the Bernalillo County Groundwater Protection Policy and Action Plan.

Development

The division of a parcel of land into two or more parcels; the construction, reconstruction, conversion, structural alteration, relocation, or enlargement of any structure; and mining, excavation, landfill, or land disturbance; and use or extension of the use of land.

DNL

The unit used to define noise contours is the average day-night sound level (DNL) or (LDN the mathematical symbol.) LDN levels of 65 and higher are those considered significant and unacceptable levels of noise exposure according to Housing and Urban Development. There is a 10-decibel (db) penalty for nighttime noises (10:00 p.m. to 7:00 a.m.) because the sounds during nighttime hours are intensified.

**Dwelling Unit** 

One or more rooms, designed, occupied, or intended for occupancy as a separate living quarter, with cooking, sleeping, and sanitary facilities provided within the dwelling unit for the exclusive use of a single family maintaining a household.

Encroachment

Any obstruction or illegal or unauthorized intrusion in a delineated floodway, right-of-way, or an adjacent land.

Historic Buildings

Any building or structure that is historically or architecturally significant.

Impact Analysis

A study to determine the potential direct or indirect effects of a proposed development on activities, utilities, circulation, surrounding land uses, community facilities, environment, and other factors.

Major Development

The County Subdivision Ordinance considers the creation of more than five lots to be a major

Minor Development

"No Build" Area

**Public Utility Facility** 

Recreational Facility

Registered Historic

Shielded and Amiable

Soil Erosion & Sediment

The County Subdivision Ordinance considers the creation of more than five lots to be a major subdivision. A major development requires the applicant of the need to meet the more stringent development requirements, such as submittal for state comments.

Any development involving five or fewer lots and/or involving a land area of less than five acres and not requiring the extension of any new streets or other municipal or governmental facilities. The designation of an application as a minor development relieves the applicant of the need to meet the more stringent requirements of a major application.

Portions of land on a lot on which no development is permitted under terrain management regulations include: Slopes of 30% or greater; Wetlands, floodways, arroyos and other natural drainage ways; and Rock outcroppings.

Public building, public utility facility, power plant, transformer yard, sewage treatment plant, sanitary solid waste incinerator, construction debris landfill, sanitary landfill and similar technical operations essential to public health and welfare.

A place designed and equipped for the conduct of sports and leisure-time activities.

Any building or structure that is historically or architecturally significant and is included on a state or federal register.

A technique of method of construction that causes all the light emitted to be directed to the surface or are to be illuminated, so that the emanating source of light is not visible from any angle except those angles that exist between the fixture and the target to be illuminated.

A plan that indicates necessary land treatment measures, including a schedule for installation, which will effectively minimize soil erosion and sedimentation.

#### Transition Area

A designated area which calls for intensive uses within an existing industrial zone to be distanced and buffered from abutting residential uses in order to protect the integrity and safety of those residential areas. The permissive uses allowed under the specific zoning designation remain intact. However, special consideration is given to the siting and placement of intensive industrial uses to mitigate any impacts it may have on established residential areas. Buffer zones and design guidelines are tools used in this process.

### Traditional Development

Long narrow lots (lineas) which are among the earliest subdivision patterns, which evolved in the Patterns valley.

### Usable Open Space

An area on the same lot with a dwelling in relation to which it serves to permanently provide light and air, as well as visual, psychological, and recreational needs for open space. Usable open space may include, but is not limited to, decorative native plants, walkways, active and passive recreational areas, and wooded areas. Usable open space does not include public right-of-way, parking lots, off-street parking, driveways, other proviOde vehicular surfaces, or buildings other than swimming pool rooms. Such space shall be available for entry and use by the residents involved. Usable open space is privately maintained.

# Appendix C - Land Evaluation and Site Assessment

#### LAND EVALUATION SITE ASSESSMENT

Southwest Area

Bernalillo County, New Mexico

#### OVERVIEW

The agricultural land evaluation and site assistment (LESA) system was created by the Natural Resources Conservation Service (formerly SCS) in 1981 as a tool for local, state and federal officials to determine which lands at a specific location should be given the highest level of protection from conversion to non-agricultural uses. LESA identifies the best land in the most valuable agricultural regions, allow local governments to direct development to non-productive or less productive lands and areas that will have the least impact on agriculture.

LESA is designed to help elected officials, citizens, farmers, soil conservationists, and planners rate a tract's soil potential for agriculture, as well as social and economic factors, such as location, access to market, and adjacent land use. It is a two-part system: The Land Evaluation (LE) portion evaluates lands for crop production using land capability classification, important farmland idientification, and soil productivity or soil potential ratings. The Site Assessment (SA) portion is designed to rate those factors other than soils and overall productivity of the land. Site assessment involves the human influences on the land, such as proximity of the land to urban centers and the amount of on-farm investments.

This LESA system was developed through the efforts of the SouthWest Area 'Agricultural Sub-Committee (1996-97). The membership included representatives of Bernolillo County, City of Albuquerque, private citizens concerned with the impact of loss of farmland being converted to residental and commerical uses in the planning area, and technical representatives of the Natural Resources Conservation Service, USDIA.

#### INSTRUCTIONS

The LE part ef-the-evaluation should be completed by a county planner at the time of a development of application request. Using the "Soil Survey of Bernoillib County, New Mexico", the soils located in the tract will be identified and acreages of each determined. The soils will be placed into their respective Agricultural Group, acreages totaled by group number. The percentage by group will be calculated and multiplied by the assigned point value for the respective group. This adjusted point value will be totaled to obtain the LE rating for the proposed development site. This value will be transfered to the Land Evaluation.

Site Assessment form on the reverse and recorded in the Land Evaluation Criteria section as Sub Total - Land Evaluation.

The SA evaluation should be conducted by a LESA Committee comprised of five (5) members. One each from County of Bernalillio and City of Albuquerque: one from either the Natural Resources Conservation Service, Farm Service Agency, County Extension Service, or Ciudad Soil & Water Conservation District; and two (2) paturate afficients residing within the boundaries of the Southwest Area Plan. This group will jointly visit the site and independently complete their own evaluation form. The results will be tabulated to show the point value assigned for each cateria. These will be totaled and a committee average will be assigned and entered into the Site Assessment Criteria section as Sub Total Site Assessment.

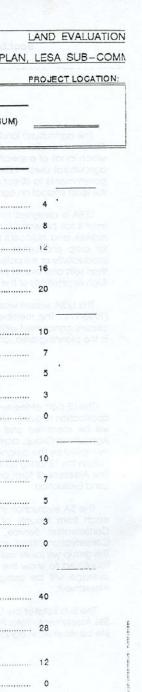

The Sub Total of the Land Evaluation and Site Assessment Criteria will be entered in the Land Evaluation Site Assessment - Total Point Rating portion of the form. A total of 180 points is required to recommend the site be retained in paricultural use.

#### SOUTHWEST AREA PLAN, LESA SUB-COMM

#### **DEFINITIONS**

**Agriculture** - is irrigated farming of lands for the purpose of producing crops, pasture, hayland, livestock, nuts, berries, orchards, vineyards, herbs, flowers and other specialty crops. Associated with it are those lands and activities common and necessary to farming such as the farmstead, corrals, sheds, stalls, corrals, barns, roads, pens, etc. found on the farm. This can include the raising of chickens, pigs, livestock, etc.

**Delivery System** – is a network of ditches, pipelines and concrete canals and associated structures that are necessary for the transporation of irrigation water through the farm providing for water to be transported to all fields where needed.

**Fallow** – is the practice of allowing an agricultural field to lay unused for a period of time as part of the crop rotation system, or for the purpose of treating the field due to some infestation, or simply because time, weather, or other conditions warrants this action.

**Agricultural potential** – includes all lands with irrigated water rights that have historically been in agricultural uses but for some reason have been abandoned or et aside and not used. These lands could be returned to their former use with a minimum of effort, and have not had a land use change since farming has ceased.

sairrigated alfalfa crop-yrald productivity lades

ite Assessment value in the application of a LESA system everal stormatives are given in the Mariagal 1984 handbook

197 defermaing seletive values, including perchied everage yield, adjusted weighted average yield an egge other measure.

For this LE ing quotient of the mean landquied alfalfa

SOUTHWEST AREA, BERNALILLO COUNTY, NEW MEXICO

- 1. The list of map units used in the LE were taken from the GIS produced soil map provided by the county planning department.
- Estimated Crop Yield
   Land Capability Classification
   Important Farmland Designation
   These soil interpretation systems were taken from the most recent version of the NRCS Technical Guide section 2.
- 3. The six Agricultural Groups are based on an interpretation of what appear to be logical breaks between LCC, Important Farmland Designation and a calculated irrigated alfalfa crop-yield productivity index.
- 4. Acres for each map unit were taken from the Bernalillo County GIS soils map legend supplied by the county.
- 5. A relative value is determined for each Ag. Group on worksheet 3. This is the value used in conjunction with the Site Assessment value in the application of a LESA system. Several alternatives are given in the National LESA handbook for determining relative values, including weighted average yield, adjusted weighted average yield or some other measure of productivity.

For this LE the quotient of the mean irrigated alfalfa yield productivity index was used.

Statewide Important soils are given a PI value of one point more than Locally Important soils. This aided in developing the Land Evaluation Agricultural Groups.
